

Dear colleague,

A PhD position (4 years) is available at our Department of Earth Sciences (Utrecht University) for a project aiming to experimentally quantify silicon isotope fractionation during precipitation of silica from solutions. Principal objective is the use of isotopic signatures of Archaean cherts in unravelling the properties of the Earth's earliest oceans.

We are looking for candidates with an MSc degree in (geo)chemistry or equivalent. Details are given in the attached pdf.

Please make potential candidates aware of this opportunity and feel free to distribute this information to anyone who might be interested.

With kind regards,

Manfred van Bergen
